

Guidelines for in vivo mouse models of myocardial infarction.

Title: Guidelines for in vivo mouse models of myocardial infarction.

Publication year: 2021

Journal: American journal of physiology. Heart and circulatory physiology

Authors: Department of Cellular and Integrative Physiology, Center for Heart and Vascular Research, University of Nebraska Medical Center, Omaha, Nebraska.

Society: European Respiratory Society

Origin country: International (Europe)

Target countries: Europe

DOI: 10.1152/ajpheart.00459.2021

PMID: 34623181

The consequent MI can, in turn, lead to remodeling of the left ventricle (LV), the development of LV dysfunction, and ultimately progression to heart failure (HF). Accordingly, an improved understanding of the underlying mechanisms of MI remodeling and progression to HF is necessary. One common approach to examine MI pathology is with murine models that recapitulate components of the clinical context of acute coronary syndrome and subsequent MI. We evaluated the different approaches used to produce MI in mouse models and identified opportunities to consolidate methods, recognizing that reperfused and nonreperfused MI yield different responses. The overall goal in compiling this consensus statement is to unify best practices regarding mouse MI models to improve interpretation and allow comparative examination across studies and laboratories. These guidelines will help to establish rigor and reproducibility and provide increased potential for clinical translation.
